

The hyperxmp package^{*}

Scott Pakin
scott+hyxmp@pakin.org

July 18, 2013

Abstract

`hyperxmp` makes it easy for an author to include XMP metadata in a PDF document produced by `LATEX`. `hyperxmp` integrates seamlessly with `hyperref` and requires virtually no modifications to a document that already specifies document metadata through `hyperref`'s mechanisms.

1 Introduction

Adobe Systems, Inc. has been promoting XMP [4]—eXtensible Metadata Platform—as a standard way to include metadata within a document. The idea behind XMP is that it is an XML-based description of various document attributes and is embedded as uncompressed, unencoded text within the document it describes. By storing the metadata this way it is independent of the document's file format. That is, regardless of whether a document is in PDF, JPEG, HTML, or any other format, it is trivial for a program (or human) to locate, extract, and—using any standard XML parser—process the embedded XMP metadata.

As of this writing there are few tools that actually do process XMP. However, it is easy to imagine future support existing in file browsers for displaying not only a document's filename but also its title, list of authors, description, and other metadata.

This is too abstract! Give me an example. Consider a `LATEX` document with three authors: Jack Napier, Edward Nigma, and Harvey Dent. The generated PDF file will contain, among other information, the following stanza of XMP code embedded within it:

```
<dc:creator>
  <rdf:Seq>
    <rdf:li>Jack Napier</rdf:li>
    <rdf:li>Edward Nigma</rdf:li>
    <rdf:li>Harvey Dent</rdf:li>
```

^{*}This document corresponds to `hyperxmp` v2.3b, dated 2013/07/18.

```

    </rdf:Seq>
  </dc:creator>

```

In the preceding code, the `dc` namespace refers to the Dublin Core schema, a collection of metadata properties. The `dc:creator` property surrounds the list of authors. The `rdf` namespace is the Resource Description Framework, which defines `rdf:Seq` as an ordered list of values. Each author is represented by an individual list item (`rdf:li`), making it easy for an XML parser to separate the authors' names.

Remember that XMP code is stored as *metadata*. It does not appear when viewing or printing the PDF file. Rather, it is intended to make it easy for applications to identify and categorize the document.

What metadata does hyperxmp process? hyperxmp knows how to embed all of the following types of metadata within a document:

- authors (`dc:creator`)
- base URL (`xmp:BaseURL`)
- copyright (`dc:rights` and `xmpRights:Marked`)
- date (`dc:date`, `xmp:CreateDate`, `xmp:ModifyDate`, and `xmp:MetadataDate`)
- document identifier (`xmpMM:DocumentID`)
- document instance identifier (`xmpMM:InstanceID`)
- file format (`dc:format`)
- keywords (`pdf:Keywords` and `dc:subject`)
- language (`dc:language`)
- L^AT_EX file name (`dc:source`)
- license URL (`xmpRights:WebStatement`)
- metadata writer (`photoshop:CaptionWriter`)
- PDF-generating tool (`pdf:Producer` and `xmp:CreatorTool`)
- PDF version (`pdf:PDFVersion`)
- primary author's position/title (`photoshop:AuthorsPosition`)
- summary (`dc:description`)
- title (`dc:title`)

- contact address (`lptc4xmpCore:CreatorContactInfo/CiAdrExtadr`,
`lptc4xmpCore:CreatorContactInfo/CiAdrCity`,
`lptc4xmpCore:CreatorContactInfo/CiAdrRegion`,
`lptc4xmpCore:CreatorContactInfo/CiAdrPcode`, and
`lptc4xmpCore:CreatorContactInfo/CiAdrCtry`)
- contact telephone number(s) (`lptc4xmpCore:CreatorContactInfo/CiTelWork`)
- contact email address(es) (`lptc4xmpCore:CreatorContactInfo/CiEmailWork`)
- contact URL(s) (`lptc4xmpCore:CreatorContactInfo/CiUrlWork`)

More types of metadata may be added in a future release.

How does `hyperxmp` compare to the `xmpincl` package? The short answer is that `xmpincl` is more flexible but `hyperxmp` is easier to use. With `xmpincl`, the author manually constructs a file of arbitrary XMP data and the package merely embeds it within the generated PDF file. With `hyperxmp`, the author specifies values for various predefined metadata types and the package formats those values as XMP and embeds the result within the generated PDF file.

`xmpincl` can embed XMP only when running under `pdfLATEX` and only when in PDF-generating mode. `hyperxmp` additionally works with a few other PDF-producing `LATEX` backends.

`hyperxmp` and `xmpincl` can complement each other. An author may want to use `hyperxmp` to produce a basic set of XMP code, then extract the XMP code from the PDF file with a text editor, augment the XMP code with any metadata not supported by `hyperxmp`, and use `xmpincl` to include the modified XMP code in the PDF file.

2 Usage

`hyperxmp` works by postprocessing some of the package options honored by `hyperref`. To use `hyperxmp`, merely put a `\usepackage{hyperxmp}` in your document's preamble. That line can appear anywhere before the `hyperref` PDF options are specified (i.e., with either `\usepackage[...]{hyperref}` or `\hypersetup{...}`). `hyperxmp` will construct its XMP data using the following `hyperref` options:

- `baseurl`
- `pdfauthor`
- `pdfkeywords`
- `pdflang`
- `pdfproducer`
- `pdfsubject`

- `pdftitle`

`hyperxmp` instructs `hyperref` also to accept the following options, which have meaning only to `hyperxmp`:

- `pdfauthortitle`
- `pdfcaptionwriter`
- `pdfcontactaddress`
- `pdfcontactcity`
- `pdfcontactcountry`
- `pdfcontactemail`
- `pdfcontactphone`
- `pdfcontactpostcode`
- `pdfcontactregion`
- `pdfcontacturl`
- `pdfcopyright`
- `pdflicenseurl`
- `pdfmetalang`

`pdfauthortitle` indicates the primary author's position or title. `pdfcaptionwriter` specifies the name of the person who added the metadata to the document. The next eight items describe how to contact the person or institution responsible for the document (the “contact”). `pdfcontactaddress` is the contact's street address and can include the institution name if the contact is an institution; `pdfcontactcity` is the contact's city. `pdfcontactcountry` is the contact's country; `pdfcontactemail` is the contact's email address (or multiple, comma-separated email addresses); `pdfcontactphone` is the contact's telephone number (or multiple, comma-separated telephone numbers); `pdfcontactpostcode` is the contact's postal code; `pdfcontactregion` is the contact's state or province; and `pdfcontacturl` is the contact's URL (or multiple, comma-separated URLs).

`pdfcopyright` defines the copyright text. `pdflicenseurl` identifies a URL that points to the document's license agreement. `pdfmetalang` indicates the natural language in which the metadata is written, typically as an IETF language tag [7], for example, “`en`” for English, “`en-US`” for specifically United States English, “`de`” for German, and so forth. If `pdfmetalang` is not specified, `hyperxmp` assumes the metadata language is the same as the document language (`hyperref`'s `pdflang` option). If neither `pdfmetalang` nor `pdflang` is specified, `hyperxmp` uses only “`x-default`” as the metadata language. Note that “`x-default`” metadata is always

included in addition to the specified metadata language, as the user reading the document may not have specified a language preference.

It is usually more convenient to provide values for those options using `hyperref`'s `\hypersetup` command than on the `\usepackage` command line. See the `hyperref` manual for more information. The following is a sample `LATEX` document that provides values for most of the metadata options that `hyperxmp` recognizes:

```
\documentclass{article}
\usepackage{hyperxmp}
\usepackage{hyperref}
\title{%
  On a heuristic viewpoint concerning the production and
  transformation of light}
\author{Albert Einstein}
\hypersetup{%
  pdftitle={%
    On a heuristic viewpoint concerning the production and
    transformation of light},
  pdfauthor={Albert Einstein},
  pdfauthortitle={Technical Assistant, Level III},
  pdfcopyright={Copyright (C) 1905, Albert Einstein},
  pdfsubject={photoelectric effect},
  pdfkeywords={energy quanta, Hertz effect, quantum physics},
  pdflicenseurl={http://creativecommons.org/licenses/by-nc-nd/3.0/},
  pdfcaptionwriter={Scott Pakin},
  pdfcontactaddress={Kramgasse 49},
  pdfcontactcity={Bern},
  pdfcontactpostcode={3011},
  pdfcontactcountry={Switzerland},
  pdfcontactphone={031 312 00 91},
  pdfcontactemail={aeinstein@ipi.ch},
  pdfcontacturl={%
    http://einstein.biz/,
    https://www.facebook.com/AlbertEinstein
  },
  pdflang={en},
  baseurl={http://www.ctan.org/tex-archive/macros/latex/contrib/hyperxmp/}
}
\begin{document}
\maketitle
A profound formal difference exists between the theoretical
concepts that physicists have formed about gases and other
ponderable bodies, and Maxwell's theory of electromagnetic
processes in so-called empty space\dots
\end{document}
```

Compile the document to PDF using any of the following approaches:

- `pdfLATEX`

- Lua \LaTeX
- \LaTeX + Dvipdfm
- \LaTeX + Dvips + Adobe Acrobat Distiller
- Xe \LaTeX

Unfortunately, the \LaTeX + Dvips + Ghostscript path doesn't work. Ghostscript bug report #690066, closed with "WONTFIX" status on 2012-05-28, explains that Ghostscript doesn't honor the `Metadata` tag needed to inject a custom XMP packet. Instead, Ghostscript fabricates an XMP packet of its own based on the metadata it finds in the PDF file's `Info` dictionary (`Author`, `Title`, `Subject`, and `Keywords`).

Once the document is compiled, the resulting PDF file will contain an XMP packet that looks something like that shown in Appendix A. Figure 1 is a screenshot of the XMP metadata as it appears in Adobe Acrobat's "Advanced" metadata dialog box. Further clicking on the "Advanced" item within that dialog box displays all of the document's metadata sorted by schema as shown in Figure 2.

Note 1: Acrobat Author bug A bug in Adobe Acrobat—at least in versions 10.0.1 and earlier—causes that PDF reader to confuse the XMP and non-XMP author lists when displaying the document's metadata. Specifically, the first author is displayed as the concatenated list of authors from the non-XMP data (`Author`) while the remaining authors are displayed from the XMP data (`dc:creator`). For example, suppose that a document's authors are Jack Napier, Edward Nigma, and Harvey Dent. When displaying the document properties, Adobe Acrobat replaces "Jack Napier" with a single author named "Jack Napier, Edward Nigma, Harvey Dent" and leaves "Edward Nigma" and "Harvey Dent" as the second and third authors, respectively.

`\XMPTruncateList` The `hyperxmp` package provides a workaround for this bug in the form of the `\XMPTruncateList` macro. `\XMPTruncateList` takes the name of a list (a `hyperref` option name) and replaces the list with the value of its first element. Currently, the only meaningful usage is to put

```
\XMPTruncateList{pdfauthor}
```

in your document's preamble. This will cause Adobe Acrobat to properly display all of the authors but at the cost of other PDF readers likely displaying only the first author.

Note 2: Acrobat multiline-field bug The IPTC Photo Metadata schema states that "the [contact] address is a multiline field" [6]. `hyperxmp` converts commas in `pdfcontactaddress`'s argument to line breaks in the generated XML. Unfortunately, A bug in Adobe Acrobat—at least in versions 10.0.1 and earlier—causes that PDF reader to discard line breaks in the contact address. Interestingly,

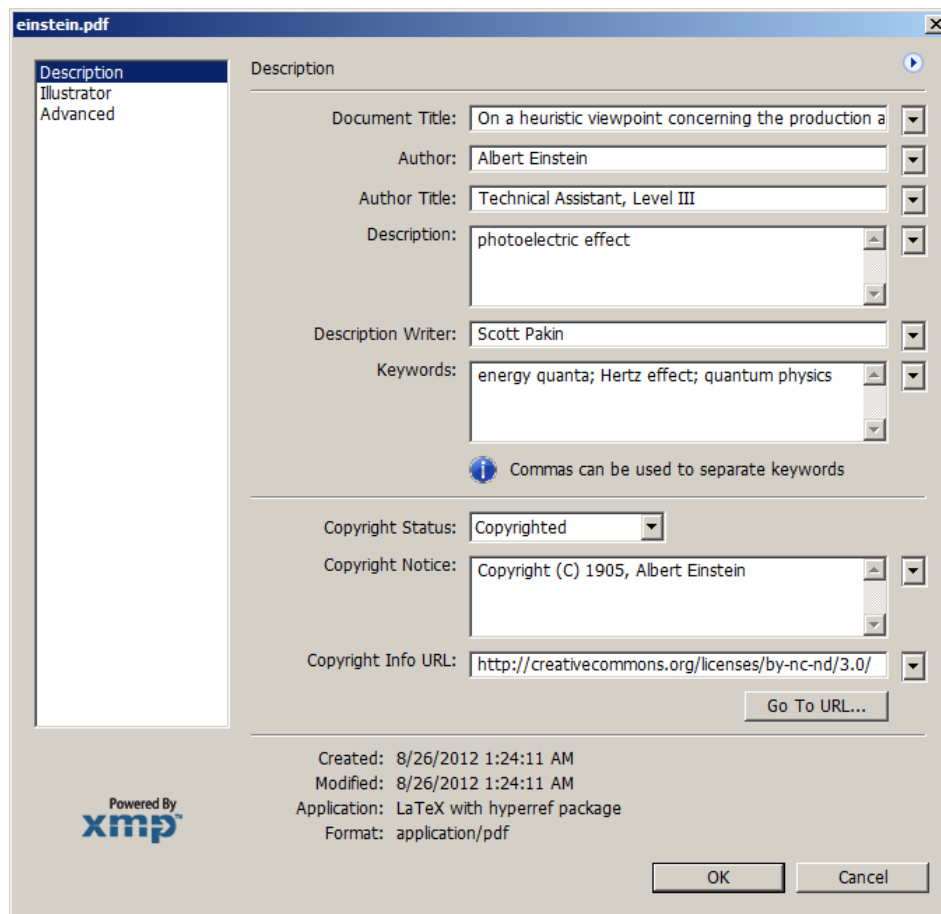

Figure 1: XMP metadata as it appears in Adobe Acrobat

`\xmplinesep` Adobe Illustrator CS5 correctly displays the contact address. If you find Adobe Acrobat's behavior bothersome, you can redefine the `\xmplinesep` macro as a string to use as an address-line separator. For example, the following replaces all commas appearing in `pdfcontactaddress`'s argument with semicolons:

```
\renewcommand*{\xmplinesep}{;}
```

Note 3: X_qL^AT_EX object compression X_qL^AT_EX (or, more precisely, the `xdvipdfmx` back end), compresses *all* PDF objects, including the ones containing XMP metadata. While Adobe Acrobat can still detect and utilize the XMP metadata, non-PDF-aware applications are unlikely to see the metadata. Three options to consider are to (1) use a different program (e.g., Lua^AT_EX), (2) pass the `--output-driver="xdvipdfmx -z0"` option to X_qL^AT_EX to instruct `xdvipdfmx` to

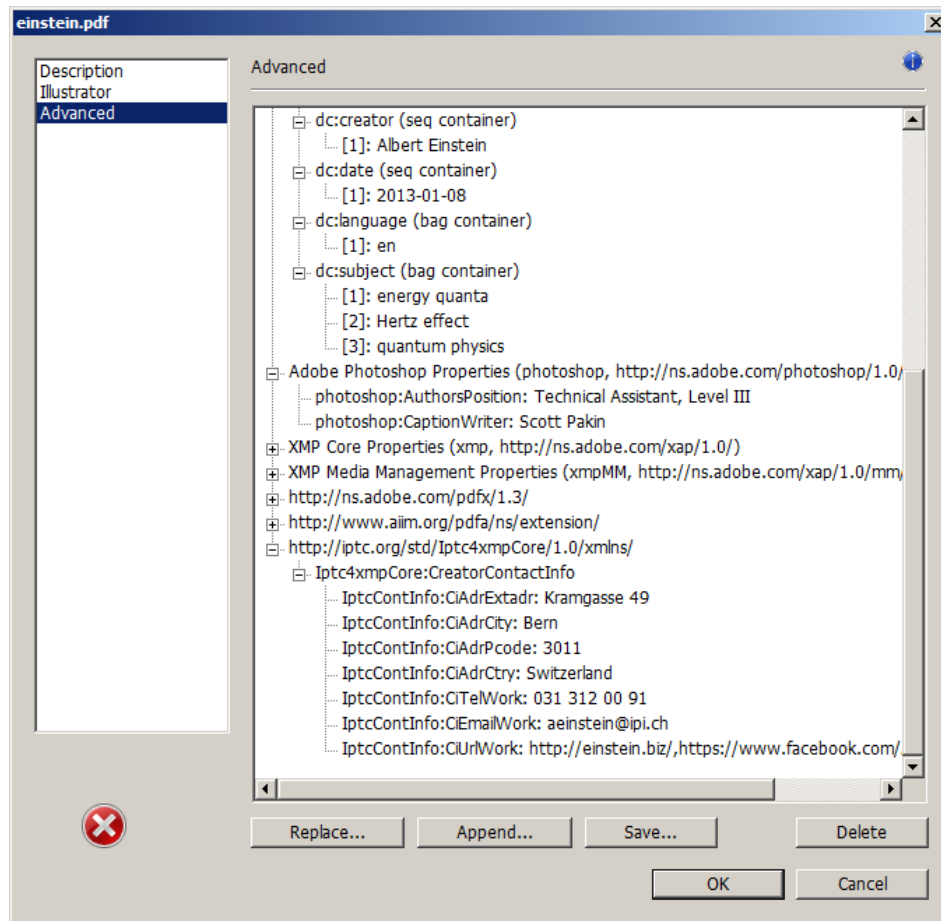

Figure 2: Additional XMP metadata as it appears in Adobe Acrobat

turn off all compression (which will of course make the PDF file substantially larger), or (3) postprocess the generated PDF file by loading it into the commercial version of Adobe Acrobat and re-saving it with the Save As... menu option.

Note 4: Literal commas hyperxmp splits the pdfauthor and pdfkeywords lists at commas. Therefore, when specifying pdfauthor and pdfkeywords, you should separate items with commas. Also, omit “and” and other text that does not belong to any list item. The following examples should serve as clarification:

Wrong: pdfauthor={Jack Napier, Edward Nigma, and Harvey Dent}

Wrong: pdfauthor={Jack Napier; Edward Nigma; Harvey Dent}

Right: pdfauthor={Jack Napier, Edward Nigma, Harvey Dent}

`\xmpcomma` If you need to include a literal comma within an author or keyword list (where commas normally separate list items) or a street address (where commas normally separate lines), use the `\xmpcomma` macro to represent it, and wrap the entire entry containing the comma within `\xmpquote{...}` as shown below:

```
pdfauthor={\xmpquote{Jack Napier\xmpcomma\ Jr.},
           \xmpquote{Edward Nigma\xmpcomma\ PhD},
           \xmpquote{Harvey Dent\xmpcomma\ Esq.}}

pdfcontactaddress={Office of the President,
                   \xmpquote{Wayne Enterprises\xmpcomma\ Inc.},
                   One Wayne Blvd}
```

As of version 2.2 of `hyperxmp`, it is acceptable to use `\xmpcomma` and `\xmpquote` within any `hyperxmp` option, not just in those in which a comma normally serves as a separator (i.e., lists and multiline fields). Outside of those cases, `\xmpcomma` is treated as an ordinary comma, and `\xmpquote` returns its argument unmodified. Hence, it is legitimate to use `\xmpcomma` and `\xmpquote` in cases like the following

```
pdfauthortitle={\xmpquote{Psychiatrist\xmpcomma\ Arkham Asylum}}
```

(Like most `hyperxmp` options, `pdfauthortitle` inserts its argument unmodified in an XMP tag.) When in doubt, use `\xmpcomma` and `\xmpquote`; it should always be safe to do so.

3 Implementation

This section presents the commented L^AT_EX source code for `hyperxmp`. Read this section only if you want to learn how `hyperxmp` is implemented.

3.1 Initial preparation

`\hyxmp@dq@code` The `ngerman` package redefines “ ” as an active character, which causes problems for `hyperxmp` when it tries to use that character. We therefore save the double-quote character’s current category code in `\hyxmp@dq@code` and mark the character as category code 12 (“other”). The original category code is restored at the end of the package code (Section 3.7).

```
1 \edef\hyxmp@dq@code{\the\catcode'\"}
2 \catcode'\ "=12
```

`\hyxmp@at@end` The `\hyxmp@at@end` macro includes code at the end of the document. For pdfT_EX, the standard `\AtEndDocument` works well enough. For all the other backends we use `\AtEndDvi` from the `atenddvi` package, which is more robust but requires an addition L^AT_EX run.

```

3 \def\hyxmp@driver{hpdftex}
4 \ifx\hyxmp@driver\Hy@driver
5   \let\hyxmp@at@end=\AtEndDocument
6 \else
7   \RequirePackage{atenddvi}
8   \let\hyxmp@at@end=\AtEndDvi
9 \fi

```

3.2 Integration with hyperref

An important design decision underlying hyperxmp is that the package should integrate seamlessly with hyperref. To that end, hyperxmp takes its XMP metadata from hyperref's pdftitle, pdfauthor, pdfsubject, pdfkeywords, and pdflang options. It also introduces five new options: pdfcopyright, pdflicenseurl, pdfauthortitle, pdfcaptionwriter, and pdfmetalang. For consistency with hyperref's document-metadata naming conventions (which are in turn based on L^AT_EX's document-metadata naming conventions), we do not prefix metadata-related macro names with our package-specific \hyxmp@ prefix. That is, we use names like \@pdfcopyright instead of \hyxmp@pdfcopyright.

We load a bunch of helper packages: kvoptions for package-option processing, pdfescape and stringenc for re-encoding Unicode strings, intcalc for performing integer calculations (division and modulo), and ifxetex for detecting X_YL_AT_EX.

```

10 \RequirePackage{kvoptions}
11 \RequirePackage{pdfescape}
12 \RequirePackage{stringenc}
13 \RequirePackage{intcalc}
14 \RequirePackage{ifxetex}

\@pdfcopyright Prepare to store the document's copyright statement.
15 \def\@pdfcopyright{}
16 \define@key{Hyp}{pdfcopyright}{\pdfstringdef\@pdfcopyright{#1}}

\@pdflicenseurl Prepare to store the URL containing the document's license agreement.
17 \def\@pdflicenseurl{}
18 \define@key{Hyp}{pdflicenseurl}{\pdfstringdef\@pdflicenseurl{#1}}

\@pdfauthortitle Prepare to store the author's position/title (e.g., Staff Writer).
19 \def\@pdfauthortitle{}
20 \define@key{Hyp}{pdfauthortitle}{\pdfstringdef\@pdfauthortitle{#1}}

\@pdfcaptionwriter Prepare to store the name of the person who inserted the hyperxmp metadata.
21 \def\@pdfcaptionwriter{}
22 \define@key{Hyp}{pdfcaptionwriter}{\pdfstringdef\@pdfcaptionwriter{#1}}

\@pdfmetalang Prepare to store the natural language of the document's metadata, typically as an
ISO 639-1 two-letter abbreviation.
23 \def\@pdfmetalang{}
24 \define@key{Hyp}{pdfmetalang}{\pdfstringdef\@pdfmetalang{#1}}

```

The following eight macros—`\@pdfcontactaddress`, `\@pdfcontactcity`, `\@pdfcontactregion`, `\@pdfcontactpostcode`, `\@pdfcontactcountry`, `\@pdfcontactphone`, `\@pdfcontactemail`, and `\@pdfcontacturl`—together specify how to contact the person or institution responsible for the document.

`\@pdfcontactaddress` Prepare to store a street address for the document’s contact person/institution. The IPTC standard defines this as follows:

The contact information address part. Comprises an optional company name and all required information to locate the building or postbox to which mail should be sent. To that end, the address is a multiline field.

For consistency with the rest of `hyperxmp`, we use commas to separate terms, in this case, lines of the address. The author can use `\xmpquote` and `\xmpcomma` to include literal commas.

```
25 \def\@pdfcontactaddress{}
26 \define@key{Hyp}{pdfcontactaddress}{%
27   \let\xmpcomma=\hyxmpcomma
28   \def\xmpquote##1{##1}%
29   \pdfstringdef\@pdfcontactaddress{#1}%
30   \def\xmpcomma{,}%
31   \let\xmpquote=\relax
32 }
```

`\@pdfcontactcity` Prepare to store the city of the document’s contact person/institution.

```
33 \def\@pdfcontactcity{}
34 \define@key{Hyp}{pdfcontactcity}{\pdfstringdef\@pdfcontactcity{#1}}
```

`\@pdfcontactregion` Prepare to store the state or province of the document’s contact person/institution.

```
35 \def\@pdfcontactregion{}
36 \define@key{Hyp}{pdfcontactregion}{\pdfstringdef\@pdfcontactregion{#1}}
```

`\@pdfcontactpostcode` Prepare to store the postal code of the document’s contact person/institution.

```
37 \def\@pdfcontactpostcode{}
38 \define@key{Hyp}{pdfcontactpostcode}{\pdfstringdef\@pdfcontactpostcode{#1}}
```

`\@pdfcontactcountry` Prepare to store the country of the document’s contact person/institution.

```
39 \def\@pdfcontactcountry{}
40 \define@key{Hyp}{pdfcontactcountry}{\pdfstringdef\@pdfcontactcountry{#1}}
```

`\@pdfcontactphone` Prepare to store the telephone number of the document’s contact person/institution.

```
41 \def\@pdfcontactphone{}
42 \define@key{Hyp}{pdfcontactphone}{\pdfstringdef\@pdfcontactphone{#1}}
```

`\@pdfcontactemail` Prepare to store the email address of the document’s contact person/institution.

```
43 \def\@pdfcontactemail{}
44 \define@key{Hyp}{pdfcontactemail}{\pdfstringdef\@pdfcontactemail{#1}}
```

`\@pdfcontacturl` Prepare to store the URL of the document's contact person/institution.

```
45 \def\@pdfcontacturl{}
46 \define@key{Hyp}{pdfcontacturl}{\pdfstringdef\@pdfcontacturl{#1}}
```

We need to capture list arguments (viz. `pdfauthor` and `pdfkeywords`) before `hyperref` converts them to `PDFDocEncoding`. Otherwise, `\xmpcomma` is permanently replaced with a comma, and we lose our ability to change it to a `\hyxmp@comma`. We therefore need to augment `hyperref`'s option processing with our own. Because `hyperref` has not yet been loaded we need to ensure that our augmentation gets loaded in the future: after the `\usepackage{hyperref}` but before options are passed to that package.

For lack of a better approach, `hyperxmp` redefines `\ProcessKeyvalOptions` to alter the way `hyperref` processes `pdfauthor` and `pdfkeywords`. This is somewhat heavy-handed as it gets executed for *every* subsequently loaded package that uses `\ProcessKeyvalOptions`, but at least it does what we need. `hyperxmp` also redefines `\hypersetup` to do the same thing. This is required in case `hyperref` is loaded before `hyperxmp`.

`\hyxmp@pdfauthor` Prepare to store the name of the author and a list of keywords.

```
\hyxmp@pdfkeywords 47 \def\hyxmp@pdfauthor{}
48 \def\hyxmp@pdfkeywords{}
```

`\hyxmp@redefine@Hyp` If not already redefined, redefine `hyperref`'s `pdfauthor` and `pdfkeywords` options to properly handle `\xmpcomma` and `\xmpquote`.

```
49 \newcommand*{\hyxmp@redefine@Hyp}{%
```

`\hyxmp@Hyp@pdfauthor` Store the old definition of `\KV@Hyp@pdfauthor` in `\hyxmp@Hyp@pdfauthor`, but only if we see that `\KV@Hyp@pdfauthor` is defined and `\hyxmp@Hyp@pdfauthor` isn't. Otherwise, we'd be defining `\hyxmp@Hyp@pdfauthor` in terms of itself and creating an infinite loop.

```
50 \@ifundefined{KV@Hyp@pdfauthor}{}{}%
51 \@ifundefined{hyxmp@Hyp@pdfauthor}{}%
52 \expandafter\let\expandafter\hyxmp@Hyp@pdfauthor
53 \csname KV@Hyp@pdfauthor\endcsname
54 }{}%
55 }%
```

`\KV@Hyp@pdfauthor` Redefine `\KV@Hyp@pdfauthor` to process its argument twice. The first time, `\xmpcomma` is defined as a placeholder character (`\hyxmp@comma`) and `\xmpquote` as the identity function. The result is stored in `\hyxmp@pdfauthor` for use in structured lists (those surrounding each entry with `<rdf:li>`). The second time, `\hyxmp@pdfauthor` `\xmpcomma` is defined as an ordinary comma, and `\xmpquote` is defined as a macro that puts its argument within double quotes. The result is stored in `\@pdfauthor` for use in unstructured lists (those in which the entire list appears within a single pair of tags).

```
56 \define@key{Hyp}{pdfauthor}{}%
57 \let\xmpcomma=\hyxmp@comma
```

```

58 \def\xmpquote####1{####1}%
59 \hyxmp@Hyp@pdfauthor{##1}%
60 \global\let\hyxmp@pdfauthor=\@pdfauthor
61 \def\xmpcomma{,}%
62 \def\xmpquote####1{"####1"%
63 \hyxmp@Hyp@pdfauthor{##1}%
64 \def\xmpcomma{,}%
65 \let\xmpquote=\relax
66 }%

```

`\hyxmp@Hyp@pdfkeywords` The previous block of code now repeats for the keyword list, starting by storing the old definition of `\KV@Hyp@pdfkeywords` in `\hyxmp@Hyp@pdfkeywords`.

```

67 \@ifundefined{KV@Hyp@pdfkeywords}{}{%
68 \@ifundefined{hyxmp@Hyp@pdfkeywords}{%
69 \expandafter\let\expandafter\hyxmp@Hyp@pdfkeywords
70 \csname KV@Hyp@pdfkeywords\endcsname
71 }{}%
72 }%

```

`\KV@Hyp@pdfkeywords` Redefine `\KV@Hyp@pdfkeywords` to process its argument twice. The first time, `\xmpcomma` is defined as a placeholder character (`\hyxmp@comma`) and `\xmpquote` as the identity function. The result is stored in `\hyxmp@pdfkeywords` for use in structured lists (those surrounding each entry with `<rdf:li>`). The second time, `\xmpcomma` is defined as an ordinary comma, and `\xmpquote` is defined as a macro that puts its argument within double quotes. The result is stored in `\@pdfkeywords` for use in unstructured lists (those in which the entire list appears within a single pair of tags).

```

73 \define@key{Hyp}{pdfkeywords}{%
74 \let\xmpcomma=\hyxmp@comma
75 \def\xmpquote####1{####1}%
76 \hyxmp@Hyp@pdfkeywords{##1}%
77 \global\let\hyxmp@pdfkeywords=\@pdfkeywords
78 \def\xmpcomma{,}%
79 \def\xmpquote####1{"####1"%
80 \hyxmp@Hyp@pdfkeywords{##1}%
81 \def\xmpcomma{,}%
82 \let\xmpquote=\relax
83 }%
84 }

```

`\hyxmp@ProcessKeyvalOptions` Redefine `kvoptions`'s `\ProcessOptions` command to invoke `\hyxmp@redefine@Hyp` before performing its normal option processing.

```

85 \let\hyxmp@ProcessKeyvalOptions=\ProcessKeyvalOptions
86 \renewcommand*{\ProcessKeyvalOptions}{%
87 \hyxmp@redefine@Hyp
88 \hyxmp@ProcessKeyvalOptions
89 }

```

```

\hyxmp@hypersetup  Redefine hyperref's \hypersetup command to invoke \hyxmp@redefine@Hyp before
\hypersetup        performing its normal option processing.
90 \let\hyxmp@hypersetup=\hypersetup
91 \def\hypersetup{%
92   \hyxmp@redefine@Hyp
93   \hyxmp@hypersetup
94 }

\hyxmp@find@metadata  Issue a warning message if the author failed to include any metadata at all. Note
\hyxmp@concat@metadata that we don't consider \@pdfmetlang as metadata as that value is meaningful
                        only when used in conjunction with other information.
95 \newcommand*{\hyxmp@find@metadata}{%
96   \edef\hyxmp@concat@metadata{%
97     \@baseurl
98     \@pdfauthor
99     \@pdfauthortitle
100    \@pdfcaptionwriter
101    \@pdfcontactaddress
102    \@pdfcontactcity
103    \@pdfcontactcountry
104    \@pdfcontactemail
105    \@pdfcontactphone
106    \@pdfcontactpostcode
107    \@pdfcontactregion
108    \@pdfcontacturl
109    \@pdfcopyright
110    \@pdfkeywords
111    \@pdflang
112    \@pdflicenseurl
113    \@pdfsubject
114    \@pdftitle
115  }%
116  \ifx\hyxmp@concat@metadata\@empty
117    \PackageWarningNoLine{hyperxmp}{%
118      \jobname.tex did not specify any metadata to\MessageBreak
119      include in the XMP packet.\space\space Please see the\MessageBreak
120      hyperxmp documentation for instructions on how to\MessageBreak
121      provide metadata values to hyperxmp}%
122  \fi
123 }

```

Rather than load `hyperref` ourselves we let the author do it then verify he actually did. This approach gives the author the flexibility to load `hyperxmp` and `hyperref` in either order and to call `\hypersetup` anywhere in the document's preamble, not just before `hyperxmp` is loaded.

```

124 \AtBeginDocument{%
125   \ifpackageloaded{hyperref}{%

```

In older versions of `hyperref`, `\@pdflang` is set to `\@empty` if `pdflang` is not specified. In newer versions of `hyperref`, `\@pdflang` is set to `\relax` if `pdflang` is not specified.

The latter is a bit problematic for `hyperxmp` because it makes `\@pdflang` non-expandable, which causes a literal “`\@pdflang`” to be written as XMP metadata. To avoid that situation we redefine `\@pdflang` as `\@empty` if we see it set to `\relax`.

```
126 \ifx\@pdflang\relax
127 \let\@pdflang=\@empty
128 \fi
```

If the user explicitly specified the language to use for the document’s metadata, we use that. If not, we use the document language, specified to `hyperref` with the `pdflang` option. If the author did not specify a language, we use `x-default` as the metadata language.

```
129 \ifx\@pdflang\@empty
130 \let\@pdfmetalang=\hyxmp@x@default
131 \else
132 \edef\@pdfmetalang{\@pdflang}%
133 \fi
134 \hyxmp@xmlify\@pdfmetalang
```

We wait until the end of the document to construct the XMP packet and write it to the PDF document catalog. This gives the author ample opportunity to provide metadata to `hyperref` and thereby `hyperxmp`.

```

144 Consequently, all hyperxmp functionality will be\MessageBreak
145 disabled}%
146 }%
147 }
```

3.3 Manipulating author-supplied data

The author provides metadata information to `hyperxmp` via package options to `hyperref` or via `hyperref`’s `\hypersetup` command. The functions in this section convert author-supplied lists (e.g., `pdfkeywords={foo, bar, baz}`) into L^AT_EX lists (e.g., `\@elt {foo} \@elt {bar} \@elt {baz}`) that can be more easily manipulated (Section 3.3.1); trim spaces off the ends of strings (Section 3.3.2); and, in Section 3.3.3, convert text to XML (e.g., from `<scott+hyxmp@pakin.org>` to `<scott+hyxmp@pakin.org>`).

3.3.1 List manipulation

We define a macro for converting a list of comma-separated elements (e.g., the list of PDF keywords) to a list of L^AT_EX `\@elt`-separated elements.

`\hyxmp@commas@to@list` Given a macro name (#1) and a comma-separated list (#2), define the macro name as the elements of the list, each preceded by `\@elt`. (Executing the macro therefore applies `\@elt` to each element in turn.)

```

148 \newcommand*{\hyxmp@commas@to@list}[2]{%
149   \gdef#1{%
150     \expandafter\hyxmp@commas@to@list@i\expandafter#1#2,,%
151   }

```

`\hyxmp@commas@to@list@i` Recursively construct macro #1 from comma-separated list #2. Stop if #2 is empty.

```

\next 152 \def\hyxmp@commas@to@list@i#1#2,{%
153   \gdef\hyxmp@sublist{#2}%
154   \ifx\hyxmp@sublist\@empty
155     \let\next=\relax
156   \else
157     \hyxmp@trimspaces\hyxmp@sublist
158     \@cons{#1}{\hyxmp@sublist}%
159     \def\next{\hyxmp@commas@to@list@i{#1}}%
160   \fi
161   \next
162 }

```

`\xmpcomma` Because `hyperxmp` splits lists at commas, a comma cannot normally be used within a list. We there provide an `\xmpcomma` macro that can expand to either a true comma or a placeholder character depending on the situation. Here, we bind it to a comma so it can be used in *any* `hyperxmp` option, not just those that treat commas specially.

```

163 \def\xmpcomma{,}%

```

`\hyxmp@comma` This is what `\xmpcomma` maps to during list construction. We assume that documents will never otherwise use an ETX (`^^C`) character in their XMP metadata.

```

164 \bgroup
165 \catcode'\^^C=11
166 \gdef\hyxmp@comma{^^C}
167 \egroup

```

`\xmpquote` Adobe Acrobat likes to see double quotes around list elements that contain commas when the entire list appears within a single XMP tag (e.g., `<pdf:Keywords>`). However, it doesn't like to see double quotes around list elements that contain commas when the list is broken up into individual components (i.e., using `<rdf:li>` tags). We therefore introduce an `\xmpquote` macro that quotes or doesn't quote its argument based on context. Here, we bind `\xmpquote` to `\relax` to prevent it from prematurely quoting or not quoting.

```

168 \let\xmpquote=\relax

```

`\XMPTruncateList` As a workaround for Adobe Acrobat's inability to display author lists correctly (cf. "Acrobat Author bug" on page 6) we introduce a hack that replaces a list with its first element. One can then write `"\XMPTruncateList{pdfauthor}"` and have

```

\@elt

```

Adobe Acrobat display the author list correctly. It's sad that this is necessary, though.

```

169 \newcommand{\XMPTruncateList}[1]{%
170   \edef\hyxmp@temp@str{\csname hyxmp@#1\endcsname}%
171   \hyxmp@commas@to@list{\hyxmp@temp@list}{\hyxmp@temp@str}%
172   \def\@elt##1{%
173     \expandafter\gdef\csname @#1\endcsname{##1}%
174     \let\@elt=\@gobble
175   }
176   \hyxmp@temp@list
177 }

```

3.3.2 Trimming leading and trailing spaces

To make it easier for XMP processors to manipulate our output we define a `\hyxmp@trimspaces` macro to strip leading and trailing spaces from various data fields.

`\hyxmp@trimspaces` Redefine a macro as its previous value but without leading or trailing spaces. This code—as well as that for its helper macros, `\hyxmp@trimb` and `\hyxmp@trimc`—was taken almost verbatim from a solution to an *Around the Bend* puzzle [5]. Inline comments are also taken from the solution text.

```

178 \catcode'\Q=3
\hyxmp@trimspaces\x redefines \x to have the same replacement text sans leading
and trailing space tokens.
179 \newcommand{\hyxmp@trimspaces}[1]{%
  Use grouping to emulate a multi-token afterassignment queue.
180   \begingroup
  Put “\toks 0 {” into the afterassignment queue.
181   \aftergroup\toks\aftergroup0\aftergroup{%
  Apply \hyxmp@trimb to the replacement text of #1, adding a leading \noexpand
  to prevent brace stripping and to serve another purpose later.
182   \expandafter\hyxmp@trimb\expandafter\noexpand#1Q Q}%
  Transfer the trimmed text back into #1.
183   \edef#1{\the\toks0}%
184 }

```

`\hyxmp@trimb` `\hyxmp@trimb` removes a trailing space if present, then calls `\hyxmp@trimc` to clean up any leftover bizarre Qs, and trim a leading space. In order for `\hyxmp@trimc` to work properly we need to put back a Q first.

```

185 \def\hyxmp@trimb#1 Q{\hyxmp@trimc#1Q}

```

`\hyxmp@trimc` Execute `\vfuzz` assignment to remove leading space; the `\noexpand` will now prevent unwanted expansion of a macro or other expandable token at the beginning

of the trimmed text. The `\endgroup` will feed in the `\aftergroup` tokens after the `\vfuzz` assignment is completed.

```
186 \def\hyxmp@trimc#1Q#2{\afterassignment\endgroup \vfuzz\the\vfuzz#1}
187 \catcode'\Q=11
```

3.3.3 Converting text to XML

The “<”, “>”, and “&” characters are significant to XML. We therefore need to escape them in any author-supplied text.

`\ifhyxmp@unicodetex` `XYTeX` and `LuaTeX` natively support Unicode. We define the conditional `\ifhyxmp@unicodetex` to check for these so we can properly handle encoding conversions. The trick here is that Unicode `TeX` implementations compare decimal 64 to hexadecimal 40 (decimal 64), specified with four carets, and take the TRUE branch; non-Unicode `TeX` implementations compare decimal 64 to character “^” (decimal 94), ignore the “^^0040” and the rest of the TRUE branch, and take the FALSE branch.

```
188 \newif\ifhyxmp@unicodetex
189 \ifnum64='^^^^0040\relax
190   \hyxmp@unicodetextrue
191 \else
192   \hyxmp@unicodetexfalse
193 \fi
```

`\hyxmp@reencode` This is now a placeholder macro needed only for `\@pdfmetalang` in the `\begin{document}`.

```
194 \newcommand*{\hyxmp@reencode}[1]{}
```

`\SE->pdfdoc@03` Preserve ETX (`^^C`), which is normally an invalid character in PDFDocEncoding. We use it in `hyperxmp` (and specifically in `\hyxmp@xmlify` below) as a list-element separator.

```
195 \expandafter\def\csname SE->pdfdoc@03\endcsname{0003}
```

`\hyxmp@xmlify` `\hyxmp@xmlified` `\hyxmp@text` Given a piece of text defined using `\pdfstringdef` (i.e., with many special characters redefined to have category code 11), set `\hyxmp@xmlified` to the same text but with all occurrences of “<” replaced with `<`; all occurrences of “>” replaced with `>`; and all occurrences of “&” replaced with `&`.

```
196 \newcommand*{\hyxmp@xmlify}[1]{%
197   \gdef\hyxmp@xmlified{}
```

258   \else

```

`dvips` wraps text when generating most PostScript code but preserves line breaks within strings. Unfortunately, `dvips` fails to observe the special case in the PostScript specification that “[b]alanced pairs of parentheses in the string require no special treatment” [2]. Consequently, XMP data containing parentheses (e.g., “Copyright (C) 1605 Miguel de Cervantes”) confuse `dvips` into thinking that the string has ended after the closing parenthesis and that line breaks can subsequently be injected safely into the document at arbitrary points for formatting purposes. This leads to erroneous display by PDF viewers, which honor line breaks within XMP tags. The solution is to insert a backslash before all parentheses when in `pdfmark`-generating mode to convince `dvips` that the entire XMP packet must be treated as a single, not-to-be-modified string.

```

259   \@ifundefined{pdfmark}{%

469   \hyxmp@create@uuid\hyxmp@InstanceID
470 }

```

3.5 Constructing the XMP packet

An XMP packet “shall consist of the following, in order: a header PI, the serialized XMP data model (the XMP packet) with optional white-space padding, and a trailer PI” [4]. (“PI” is an abbreviation for “processing instructions”). The serialized XMP includes blocks of XML for various XMP schemata: Adobe PDF (Section 3.5.2), Dublin Core (Section 3.5.3), XMP Rights Management (Section 3.5.4), XMP Media Management (Section 3.5.5), XMP Basic (Section 3.5.6), Photoshop (Section 3.5.7), and IPTC Photo Metadata (Section 3.5.8). The `\hyxmp@construct@packet` macro constructs the XMP packet into `\hyxmp+xml`. It first writes the appropriate XML header, then calls the various schema-writing macros, then injects `\hyxmp@padding` as padding, and finally writes the appropriate XML trailer.

3.5.1 XMP utility functions

`\hyxmp@add@to+xml` Given a piece of text, replace all underscores with category-code 11 (“other”) spaces and all `^C` characters with commas, then append the result to the `\hyxmp+xml` macro.

```

471 \newcommand*{\hyxmp@add@to+xml}[1]{%
472   \bgroup
473   \@tempcnta=0
474   \loop
475     \lccode\@tempcnta=\@tempcnta
476     \advance\@tempcnta by 1
477     \ifnum\@tempcnta<256
478       \repeat
479       \lccode'\_='\ \relax
480       \lccode'\^C='\,\relax
481       \lowercase{\xdef\hyxmp+xml{\hyxmp+xml#1}}%
482   \egroup
483 }

```

`\hyxmp@hash` Define a category-code 11 (“other”) version of the “#” character.

```

484 \bgroup
485 \catcode'\#=11

```

```

486 \gdef\hyxmp@hash{#}
487 \egroup

\hyxmp@padding The XMP specification recommends leaving approximately 2000 bytes of whites-
\hyxmp+xml    pace at the end of each XMP packet to facilitate editing the packet in place [4].
               \hyxmp@padding is defined to contain 32 lines of 50 spaces and a newline apiece
               for a total of 1632 characters of whitespace.

488 \bgroup
489 \xdef\hyxmp+xml{%
490 \hyxmp@add@to+xml{%
491 ----- ^^J%
492 }
493 \xdef\hyxmp@padding{\hyxmp+xml}%
494 \egroup
495 \xdef\hyxmp@padding{\hyxmp@padding\hyxmp@padding}
496 \xdef\hyxmp@padding{\hyxmp@padding\hyxmp@padding}
497 \xdef\hyxmp@padding{\hyxmp@padding\hyxmp@padding}
498 \xdef\hyxmp@padding{\hyxmp@padding\hyxmp@padding}
499 \xdef\hyxmp@padding{\hyxmp@padding\hyxmp@padding}

\hyxmp@today Define today's date in YYYY-MM-DD format.

500 \xdef\hyxmp@today{\the\year}%
501 \ifnum\month<10
502 \xdef\hyxmp@today{\hyxmp@today-0\the\month}%
503 \else
504 \xdef\hyxmp@today{\hyxmp@today-\the\month}%
505 \fi
506 \ifnum\day<10
507 \xdef\hyxmp@today{\hyxmp@today-0\the\day}%
508 \else
509 \xdef\hyxmp@today{\hyxmp@today-\the\day}%
510 \fi

\hyxmp@x@default Define an x-default string that we can use in comparisons with \@pdfmetalang.
511 \newcommand*{\hyxmp@x@default}{x-default}

3.5.2 The Adobe PDF schema

\hyxmp@pdf@schema Add properties defined by the Adobe PDF schema to the \hyxmp+xml macro.
512 \newcommand*{\hyxmp@pdf@schema}{%

\hyxmp@have@any Include an Adobe PDF schema block if at least one of \@pdfkeywords and
\@pdfproducer is defined.

513 \let\hyxmp@have@any=!%
514 \ifx\@pdfkeywords\@empty
515 \ifx\@pdfproducer\@empty
516 \let\hyxmp@have@any=\@empty
517 \fi
518 \fi

```

```

519 \ifx\hyxmp@have@any\@empty
520 \else
    Add a block of XML to \hyxmp@xml that lists the document's keywords (the
    pdf:Keywords property) and the tools used to produce the PDF file (the pdf:Producer
    property).
521 \hyxmp@add@to@xml{%
522 -----<rdf:Description rdf:about=""^^J%
523 -----xmlns:pdf="http://ns.adobe.com/pdf/1.3/">^^J%
524 }%
525 \hyxmp@add@simple{pdf:Keywords}{\@pdfkeywords}%
526 \hyxmp@add@simple{pdf:Producer}{\@pdfproducer}%
527 \@ifundefined{pdfminorversion}{\{}{%
528 \hyxmp@add@simple{pdf:PDFVersion}{1.\the\pdfminorversion}%
529 }%
530 \hyxmp@add@to@xml{%
531 -----</rdf:Description>^^J%
532 }%
533 \fi
534 }

```

\hyxmp@add@simple Given an XMP tag (#1) and a string (#2), if the string is nonempty, add a begin tag, the string, and an end tag to the packet. The “simple” in the macro name indicates that the string is output without variations for different languages.

```

535 \newcommand*{\hyxmp@add@simple}[2]{%
536 \edef\hyxmp@string{#2}%
537 \ifx\hyxmp@string\@empty
538 \else
539 \hyxmp@xmlify{\hyxmp@string}%
540 \hyxmp@add@to@xml{%
541 -----<#1>\hyxmp@xmlified</#1>^^J%
542 }%
543 \fi
544 }

```

3.5.3 The Dublin Core schema

\hyxmp@rdf@dc Given a Dublin Core property (#1) and a macro containing some \pdfstringdefined text (#2), append the appropriate block of XML to the \hyxmp@xml macro but only if #2 is non-empty.

```

545 \newcommand*{\hyxmp@rdf@dc}[2]{%
546 \ifx#2\@empty
547 \else
548 \hyxmp@xmlify{#2}%
549 \hyxmp@add@to@xml{%
550 -----<dc:#1>^^J%
551 -----<rdf:Alt>^^J%
552 }%
553 \ifx\@pdfmetalang\hyxmp@x@default

```

```

554     \else
555     \hyxmp@add@to@xml{%
556 -----<rdf:li xml:lang="\pdfmetalang">\hyxmp@xmlified</rdf:li>^^J%
557     }%
558     \fi
559     \hyxmp@add@to@xml{%
560 -----<rdf:li xml:lang="\hyxmp@x@default">\hyxmp@xmlified</rdf:li>^^J%

599   \hyxmp@list@to@xml{subject}{Bag}{\hyxmp@pdfkeywords}%
600   \hyxmp@list@to@xml{date}{Seq}{\hyxmp@today}%
601   \hyxmp@add@simple{dc:language}{\@pdflang}%
602   \hyxmp@add@simple{dc:source}{\jobname.tex}%
603   \hyxmp@add@to@xml{%
604     </rdf:Description>^^J%
605   }%
606 }
```

3.5.4 The XMP Rights Management schema

`\hyxmp@xmpRights@schema` Add properties defined by the XMP Rights Management schema to the `\hyxmp@xml` macro. Currently, these are only the `xmpRights:Marked` property and the `xmpRights:WebStatement` property. If the author specified a copyright statement we mark the document as copyrighted. If the author specified a license statement we include the URL in the metadata.

```

607 \newcommand*{\hyxmp@xmpRights@schema}{%
```

`\hyxmp@legal` Set `\hyxmp@rights` to YES if either `pdfcopyright` or `pdflicenseurl` was specified.

```

608   \let\hyxmp@rights=\@empty
609   \ifx\@pdflicenseurl\@empty
610   \else
611     \def\hyxmp@rights{YES}%
612   \fi
613   \ifx\@pdfcopyright\@empty
614   \else
615     \def\hyxmp@rights{YES}%
616   \fi
```

Include the license-statement URL and/or the copyright indication. The copyright statement itself is included by `\hyxmp@dc@schema` in Section 3.5.3.

```

617   \ifx\hyxmp@rights\@empty
618   \else
```

Header

```

619     \hyxmp@add@to@xml{%
```

```

620 -----<rdf:Description rdf:about=""^^J%
621 -----xmlns:xmpRights="http://ns.adobe.com/xap/1.0/rights/">^^J%
622  }%
    Copyright indication
623   \ifx\@pdfcopyright\@empty
624   \else

    License URL
629   \hyxmp@add@simple{xmpRights:WebStatement}{\@pdflicenseurl}%
    Trailer
630   \hyxmp@add@to@xml{%
631 -----</rdf:Description>^^J%
632   }%
633   \fi
634 }

```

3.5.5 The XMP Media Management schema

`\hyxmp@mm@schema` Add properties defined by the XMP Media Management schema to the `\hyxmp@xml` macro. According to the XMP specification, the `xmpMM:DocumentID` property is supposed to uniquely identify a document, and the `xmpMM:InstanceID` property is supposed to change with each save operation [4]. As seen in Section 3.4, we do what we can to honor this intention from within a \TeX -based workflow.

```

635 \gdef\hyxmp@mm@schema{%
636   \hyxmp@def@DocumentID
637   \hyxmp@def@InstanceID
638   \hyxmp@add@to@xml{%
639 -----<rdf:Description rdf:about=""^^J%
640 -----xmlns:xmpMM="http://ns.adobe.com/xap/1.0/mm/">^^J%
641 -----<xmpMM:DocumentID>\hyxmp@DocumentID</xmpMM:DocumentID>^^J%
642 -----<xmpMM:InstanceID>\hyxmp@InstanceID</xmpMM:InstanceID>^^J%
643 -----</rdf:Description>^^J%
644   }%
645 }

```

3.5.6 The XMP Basic schema

`\hyxmp@xmp@basic@schema` Add properties defined by the XMP Basic schema to the `\hyxmp@xml` macro. These include a bunch of dates (all set to the same value) and the base URL for the document if specified with `baseurl`.

```

646 \newcommand*{\hyxmp@xmp@basic@schema}{%
647   \hyxmp@add@to@xml{%
648 -----<rdf:Description rdf:about=""^^J%
649 -----xmlns:xmp="http://ns.adobe.com/xap/1.0/">^^J%

```

```

650 }%
651 \hyxmp@add@simple{xmp:CreateDate}{\hyxmp@today}%
652 \hyxmp@add@simple{xmp:ModifyDate}{\hyxmp@today}%
653 \hyxmp@add@simple{xmp:MetadataDate}{\hyxmp@today}%
654 \hyxmp@add@simple{xmp:CreatorTool}{\pdfcreator}%
655 \hyxmp@add@simple{xmp:BaseURL}{\@baseurl}%
656 \hyxmp@add@to@xml{%
657 -----</rdf:Description>^^J%
658 }%
659 }

```

3.5.7 The Photoshop schema

`\hyxmp@photoshop@schema` Add properties defined by the Photoshop schema to the `\hyxmp@xml` macro. We
`\hyxmp@photoshop@data` currently support only the `photoshop:AuthorsPosition` and `photoshop:CaptionWriter`
properties.

```

660 \gdef\hyxmp@photoshop@schema{%
661 \edef\hyxmp@photoshop@data{\@pdfauthortitle\@pdfcaptionwriter}%
662 \ifx\hyxmp@photoshop@data\@empty
663 \else
664 \hyxmp@add@to@xml{%
665 -----<rdf:Description rdf:about=""^^J%
666 -----_xmlns:photoshop="http://ns.adobe.com/photoshop/1.0/">^^J%
667 }%
668 \fi
669 \hyxmp@add@simple{photoshop:AuthorsPosition}{\@pdfauthortitle}%
670 \hyxmp@add@simple{photoshop:CaptionWriter}{\@pdfcaptionwriter}%
671 \ifx\hyxmp@photoshop@data\@empty
672 \else
673 \hyxmp@add@to@xml{%
674 -----</rdf:Description>^^J%
675 }%
676 \fi
677 }

```

3.5.8 The IPTC Photo Metadata schema

`\xmplinesep` Lines in multiline fields are separated by `\xmplinesep` in the generated XML. This
defaults to an LF (`^^J`) character but written as an XML character entity for
consistency across operating systems.

```

678 \begingroup
679 \catcode'\&=12
680 \catcode'\#=12
681 \gdef\xmplinesep{&#xA;}
682 \endgroup

```

`\hyxmp@list@to@lines` Given a property (#1) and a macro containing a comma-separated list (#2), replace
commas with `\xmplinesep`. Do nothing if the list is empty.

```

683 \newcommand*{\hyxmp@list@to@lines}[2]{%

```

```

684 \ifx#2\@empty
685 \else
686 \bgroup
687 \hyxmp@add@to@xml{%
688 -----<#1>%
689 }%

```

`\@elt@first` The first element of the list is output as is.

```

690 \def\@elt@first##1{%
691 \hyxmp@add@to@xml{##1}%
692 \let\@elt=\@elt@rest
693 }%

```

`\@elt@rest` The remaining elements of the list are output with a preceding line separator (`\xmplinesep`).

```

694 \def\@elt@rest##1{%
695 \hyxmp@add@to@xml{\xmplinesep##1}%
696 }%

```

`\@elt` Re-encode the text from Unicode if necessary. Then redefine `\@elt` to insert a line separator between terms.

```

697 \let\@elt=\@elt@first
698 \hyxmp@xmllify{#2}%
699 \hyxmp@commas@to@list\hyxmp@list{\hyxmp@xmllified}%

728 \hyxmp@add@simple{IptcContInfo: CiAdrRegion}{\@pdfcontactregion}%
729 \hyxmp@add@simple{IptcContInfo: CiAdrPcode}{\@pdfcontactpostcode}%
730 \hyxmp@add@simple{IptcContInfo: CiAdrCtry}{\@pdfcontactcountry}%

```

\xmplinesep The IPTC standard states that sets of telephone numbers, email address, and URLs for the contact person or institution, “[m]ay have to be separated by a comma in the user interface” [6]. This is rather ambiguous: Does the comma appear *only* in the user interface or also in the generated XML? Here we assume the latter interpretation and temporarily redefine \xmplinesep as a comma and use \hyxmp@list@to@lines to insert the data. Unlike \hyxmp@add@simple, this approach trims all spaces surrounding commas.

```

\hyxmp@iptc@extensions Because IPTC metadata are not recognized by the PDF/A standard, PDF/A conversion would normally fail for documents that utilize \pdfcontactaddress, \pdfcontactcity, etc. However, there exists a technique, described in a PDF Association technical note [8], for describing nonstandard XMP metadata within the XMP packet itself. We use that technique here to describe all of the metadata that \hyxmp@photometa@schema can produce. Doing so enables the document to be converted to PDF/A format.

```

3.6 Embedding the XMP packet

The PDF specification says that “a metadata stream may be attached to a document through the Metadata entry in the document catalogue” [3] so that’s what we do here.

`\hyxmp@embed@packet` Determine which hyperref driver is in use and invoke the appropriate embedding function.
`\hyxmp@driver`

```

843 \newcommand*{\hyxmp@embed@packet}{%
844   \hyxmp@construct@packet
845   \def\hyxmp@driver{hpdfTEX}%
846   \ifx\hyxmp@driver\Hy@driver
847     \hyxmp@embed@packet@pdfTEX
848   \else
849     \def\hyxmp@driver{hdvipdfm}%
850     \ifx\hyxmp@driver\Hy@driver
851       \hyxmp@embed@packet@dviPDFM
852     \else
853       \def\hyxmp@driver{hXeTeX}%
854       \ifx\hyxmp@driver\Hy@driver
855         \hyxmp@embed@packet@XeTeX
856       \else
857         \ifundefined{pdfmark}{%
858           \PackageWarningNoLine{hyperxmp}{%
859             Unrecognized hyperref driver ‘\Hy@driver’.\MessageBreak
860             \jobname.tex’s XMP metadata will *not* be\MessageBreak
861             embedded in the resulting file}%
862         }{%
863           \hyxmp@embed@packet@pdfmark
864         }%
865       \fi
866     \fi
867   \fi
868 }

```

3.6.1 Embedding using pdfTeX

`\hyxmp@embed@packet@pdfTEX` Embed the XMP packet using pdfTeX primitives.

```

869 \newcommand*{\hyxmp@embed@packet@pdfTEX}{%
870   \bgroup
871   \pdfcompresslevel=0
872   \immediate\pdfobj stream attr {%

```

```

873      /Type /Metadata
874      /Subtype /XML
875    }{\hyxmp@xml}%
876    \pdfcatalog {/Metadata \the\pdflastobj\space 0 R}%
877  \egroup
878 }

```

3.6.2 Embedding using any pdfmark-based backend

`\hyxmp@embed@packet@pdfmark` Embed the XMP packet using `hyperref`'s `\pdfmark` command. I believe `\pdfmark` is used by the `dvipdf`, `dvipsone`, `dvips`, `dviwindo`, `nativepdf`, `pdfmark`, `ps2pdf`, `textures`, and `vtexpdfmark` options to `hyperref` but I've tested only a few of those.

```

879 \newcommand*{\hyxmp@embed@packet@pdfmark}{%
880   \pdfmark{%
881     pdfmark=/NamespacePush
882   }%
883   \pdfmark{%
884     pdfmark=/OBJ,
885     Raw={/_objdef \string{hyxmp@Metadata\string} /type /stream}%
886   }%
887   \pdfmark{%
888     pdfmark=/PUT,
889     Raw={\string{hyxmp@Metadata\string}
890       2 dict begin
891         /Type /Metadata def
892         /Subtype /XML def
893         currentdict
894       end
895     }%
896   }%
897   \pdfmark{%
898     pdfmark=/PUT,
899     Raw={\string{hyxmp@Metadata\string} (\hyxmp@xml)}%
900   }%
901   \pdfmark{%
902     pdfmark=/Metadata,
903     Raw={\string{Catalog\string} \string{hyxmp@Metadata\string}}%
904   }%
905   \pdfmark{%
906     pdfmark=/NamespacePop
907   }%
908 }

```

3.6.3 Embedding using dvipdfm

`\hyxmp@embed@packet@dvipdfm` Embed the XMP packet using `dvipdfm`-specific `\special` commands. Note that `dvipdfm` rather irritatingly requires us to count the number of characters in the `\hyxmp@xml` stream ourselves.

```

909 \newcommand*{\hyxmp@embed@packet@dvipdfm}{%

```

```

910 \hyxmp@string@len{\hyxmp@xml}%
911 \special{pdf: object @hyxmp@Metadata
912   <<
913     /Type /Metadata
914     /Subtype /XML
915     /Length \the\@tempcnta
916   >>
917   stream^^J\hyxmp@xml endstream%
918 }%
919 \special{pdf: docview
920   <<
921     /Metadata @hyxmp@Metadata
922   >>
923 }%
924 }

```

`\hyxmp@string@len` Set `\@tempcnta` to the number of characters in a given string (`#1`). The approach is first to tally the number of space characters then to tally the number of non-space characters. While this is rather sloppy I haven't found a better way to achieve the same effect, especially given that all of the characters in `#1` have already been assigned their category codes.

```

925 \newcommand*{\hyxmp@string@len}[1]{%
926   \@tempcnta=0
927   \expandafter\hyxmp@count@spaces#1 {} %
928   \expandafter\hyxmp@count@non@spaces#1{}%
929 }

```

`\hyxmp@count@spaces` Count the number of spaces in a given string. We rely on the built-in pattern matching of \TeX 's `\def` primitive to pry one word at a time off the head of the input string.

```

930 \def\hyxmp@count@spaces#1 {%
931   \def\hyxmp@one@token{#1}%
932   \ifx\hyxmp@one@token\empty
933     \advance\@tempcnta by -1
934   \else
935     \advance\@tempcnta by 1
936     \expandafter\hyxmp@count@spaces
937   \fi
938 }

```

`\hyxmp@count@non@spaces` Count the number of non-spaces in a given string. Ideally, we'd count both spaces and non-spaces but \TeX won't bind `#1` to a space character (category code 10). Hence, in each iteration, `#1` is bound to the next non-space character only.

```

939 \newcommand*{\hyxmp@count@non@spaces}[1]{%
940   \def\hyxmp@one@token{#1}%
941   \ifx\hyxmp@one@token\empty
942     \else
943       \advance\@tempcnta by 1
944       \expandafter\hyxmp@count@non@spaces

```

```

945 \fi
946 }

```

3.6.4 Embedding using X_YTeX

`\hyxmp@embed@packet@xetex` Embed the XMP packet using `xdvipdfmx`-specific `\special` commands. I don't know how to tell `xdvipdfmx` always to leave the Metadata stream uncompressed, so the XMP metadata is likely to be missed by non-PDF-aware XMP viewers.

```

947 \newcommand*{\hyxmp@embed@packet@xetex}{%
948   \special{pdf:stream @hyxmp@Metadata (\hyxmp@xml)
949     <<
950       /Type /Metadata
951       /Subtype /XML
952     >>
953   }%
954   \special{pdf:put @catalog
955     <<
956       /Metadata @hyxmp@Metadata
957     >>
958   }%
959 }

```

3.7 Final clean-up

Having saved the category code of “ ” at the start of the package code (Section 3.1), we now restore that character's original category code.

```

960 \catcode'\=" \hyxmp@dq@code

```

4 Future Work

Help wanted Ideally, `\xmpquote` should automatically replace all commas with `\xmpcomma`. Unfortunately, my TeX skills are insufficient to pull that off. If you know a way to make `\xmpquote{Hello, world}` work with both Unicode and non-Unicode encodings and with all TeX engines (pdfTeX, LuaTeX, X_YTeX, etc.), please send me a code patch.

A Sample XMP packet

The following is an example of a complete XMP packet as may be produced by `hyperxmp`. This packet corresponds to the metadata included in the sample L^AT_EX document presented on page 5. For clarity, metadata values, either specified explicitly by the document or introduced automatically by `hyperxmp`, are colored blue.

```

Change History

v1.0	General: Initial version	1	Basic schema and miscellaneous other bits of metadata	1
v1.1	<code>\hyxmp@construct@packet</code> : Explicitly set the category codes of characters $\langle EF \rangle$, $\langle BB \rangle$, and $\langle BF \rangle$ to “letter”. Thanks to Daniel Schömer for the bug report	36	Heiko Oberdiek’s major rewrite of the code to better support native-Unicode TeX implementations (XeTeX and LuaTeX)	1
v1.2	General: Added support for the XeTeX backend (<code>xdvipdfmx</code>)	1	New <code>\AtBeginDocument</code> code from Heiko Oberdiek to properly encode <code>\pdfmetalang</code>	15
	Added support for the Photoshop schema	1	<code>\hyxmp@add@to+xml</code> : Updated also to replace commas	26
	Made the package compatible with <code>ngerman</code> . Thanks to Tobias Mueller for the bug report.	9	<code>\hyxmp@bom</code> : Added by Heiko Oberdiek	36
v1.3	General: Introduced the <code>pdfmetalang</code> package option, which enables an author to specify the language in which he wrote the document’s metadata	15	<code>\hyxmp@comma</code> : Added this macro	16
	<code>\hyxmp@reencode</code> : Introduced this macro to re-encode Unicode strings as 8-bit strings before manipulating them into XMP schema. This change addresses a bug reported by Martin Münch	18	<code>\hyxmp@construct@packet</code> : Modified by Heiko Oberdiek to use an appropriate BOM representation via <code>\hyxmp@bom</code>	36
v1.4	<code>\hyxmp@mm@schema</code> : Renamed the <code>xapMM</code> namespace prefix to <code>xmpMM</code>	31	<code>\hyxmp@crap@convert</code> : Added by Heiko Oberdiek	22
	<code>\hyxmp@rdf@dc</code> : Included metadata in the <code>x-default</code> language regardless of the specified metadata language	28	<code>\hyxmp@crap@test</code> : Added by Heiko Oberdiek	22
	<code>\hyxmp@xmpRights@schema</code> : Renamed the <code>xapRights</code> namespace prefix to <code>xmpRights</code>	30	<code>\hyxmp@dc@schema</code> : Added support for <code>dc:language</code> and <code>dc:source</code>	30
v1.5	General: Made the XMP inclusion more robust. Thanks to Heiko Oberdiek for the bug report and suggested modifications.	9	<code>\hyxmp@is@unicode</code> : Added by Heiko Oberdiek	19
v2.0	General: Added support for the XMP		<code>\hyxmp@list@to+xml</code> : Modified by Heiko Oberdiek to use the new Unicode-processing macros	29
			<code>\hyxmp@photoshop@schema</code> : Simplified using <code>\hyxmp@add@simple</code>	32
			<code>\hyxmp@ProcessKeyvalOptions</code> : Added this macro	13
			<code>\hyxmp@reencode</code> : Replaced with an empty macro by Heiko Oberdiek	18
			<code>\hyxmp@skiptorelax</code> : Added by Heiko Oberdiek	22
			<code>\hyxmp@skipzeros</code> : Added by Heiko Oberdiek	21
			<code>\hyxmp@SpaceOther</code> : Added by Heiko Oberdiek	22
			<code>\hyxmp@string</code> : Added this macro	28
			<code>\hyxmp@toxml</code> : Added by Heiko Oberdiek	20
			Escaped parentheses written with <code>pdfmarks</code> to prevent dvips from	

line-wrapping the XMP packet	20	<code>\hyxmp@hypersetup</code> : Added this macro	13
<code>\hyxmp@toxml@unicodetex</code> : Added by Heiko Oberdiek	21	<code>\hyxmp@redefine@Hyp</code> : Added this macro	12
<code>\hyxmp@xetex@crap</code> : Added by Heiko Oberdiek	21	v2.2	
<code>\hyxmp@xmlify</code> : Completely rewritten by Heiko Oberdiek to better support Unicode-enabled T _E X programs	18	General: Added support for the IPTC Photo Metadata schema	1
<code>\hyxmp@xmp@basic@schema</code> : Added this macro	31	<code>\hyxmp@iptc@extensions</code> : Added this macro to support PDF/A generation	34
<code>\hyxmp@xmpRights@schema</code> : Modified to include <code>xmpRights:Marked</code> only when <code>pdfcopyright</code> is specified and <code>xmpRights:WebStatement</code> only when <code>pdflicenseurl</code> is specified	30	<code>\hyxmp@list@to@lines</code> : Added this macro	32
<code>\hyxmp@zero</code> : Added by Heiko Oberdiek	23	<code>\hyxmp@photometa@schema</code> : Added this macro	33
<code>\ifhyxmp@unicodetex</code> : Added by Heiko Oberdiek	18	<code>\hyxmp@text@resource</code> : Added this macro	36
<code>\ProcessKeyvalOptions</code> : Added this macro	13	<code>\xmpcomma</code> : Changed the default from <code>\relax</code> to an ordinary comma	16
<code>\xmpcomma</code> : Added this macro	16	<code>\xmplinesep</code> : Added this macro	32
<code>\xmpquote</code> : Added this macro	16	v2.3	
<code>\XMPTruncateList</code> : Added this macro	16	<code>\hyxmp@iptc@extensions</code> : Gave the <code>lptc4xmpCore:CreatorContactInfo</code> fields a unique <code>pdfaType:prefix</code> to better support conversion of the document to PDF/A	34
v2.1		v2.3a	
General: Enabled <code>hyperxmp</code> and <code>hyperref</code> to be loaded in either order. This addresses a bug report by Yury Donskoy	12	General: Bug fix: Redefine <code>\@pdflang</code> as <code>\@empty</code> when <code>hyperref</code> has set it to <code>\relax</code>	15
<code>\hypersetup</code> : Added this macro	13	v2.3b	
		<code>\XMPTruncateList</code> : Made all definitions local to avoid spurious <code>Too many unprocessed floats</code> errors when running with <code>memoir</code>	16

Index

Numbers written in *italic* refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
